

## Semper 6 Command Reference

### execute

<b>keys:</b>	<b>after</b>	'<text>'	execute the specified string after every Semper command
	<b>before</b>	'<text>'	execute the specified string before every Semper command
<b>options:</b>	<b>off/on</b>		disable/enable 'before and after' command execution

The **execute** command defines the actions to be carried out immediately before and after a Semper command is executed.

#### Examples

```
execute before 'type "About to execute command"'
```

This command types out the message *About to execute command* each time Semper goes to the user-interface for input. Note that this will *not* occur during the execution of library files.

```
execute off
```

This command disables the defined **execute** actions.

#### Description

If **execute** is used more than once, the actions are accumulated, not overwritten. If you enter several commands on one line using a semi-colon';', the action is executed before and after the entire sequence of Semper commands, not before each element in the string.

#### Defaults and Ranges

keys/options	defaults	range
<b>after</b>	<i>none</i>	text string; length is installation dependent
<b>before</b>	<i>none</i>	text string; length is installation dependent
<b>off/on</b>	execution on
